

Ashley Leung graduated with a degree in biomedical engineering from UConn in 2019. As an undergraduate student, she was heavily involved in Engineering Ambassadors, the Society of Women Engineers, and the SPARK summer program. Today, she is a test engineer at Medtronic, a company that makes medical devices such as surgical staplers and access ports. She does unbiased testing using Instron mechanical testers and scanning electron microscopy for various efforts to ensure products are safe and effective. Essentially, her job lets her break and pull things apart in the name of science. In her free time, she enjoys reading, cooking, visiting farmers markets, and training in mixed martial arts.
