

Leah Mummert bio

Quality engineer, continuous improvement

In my role I help solve problems across our organization and train others in tools and methodologies to apply to solve all kinds of problems. Some of these may be to reduce specific issues with our manufacturing equipment which cause product scrap or defects. When we find the root causes of these issues and implement effective solutions we can improve efficiency, reduce waste, and boost employee morale!

I also lead projects to achieve various business and functional objectives. Some of these projects are to put in place certification programs for areas of key competency across over 20 global locations our business. Others are to develop inspiring and informational collateral about our products to educate manufacturing associates and enhance the culture.

I work at a very large company who manufactures a wide variety of products that people need daily! We have global locations which produce these products that I interact with.
